Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment, USP

Sterile
Rx only

DESCRIPTION
Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment, USP is a multiple dose anti-infective steroid combination in sterile ointment form for topical application.

The chemical structure for the active ingredient Neomycin Sulfate is:

\[ \text{C}_{23}\text{H}_{46}\text{N}_{6}\text{O}_{13}, x \text{H}_{2}\text{SO}_{4} \]

\[ M_{r} 615 \text{ (base)} \]

The chemical structure for the active ingredient Polymyxin B Sulfate is:

Each gram contains: Actives:
- Neomycin sulfate equivalent to neomycin 3.5 mg, polymyxin B sulfate 10,000 units, dexamethasone 0.1%.
- Preservatives: methylparaben 0.05%, propylparaben 0.01%.
- Inactives: white petrolatum, lanolin, mineral oil.

CLINICAL PHARMACOLOGY
Corticosteroids suppress the inflammatory response to a variety of agents and they probably delay or slow healing. Since corticosteroids may inhibit the body’s defense mechanism against infection, a concomitant antimicrobial drug may be used when this inhibition is considered to be clinically significant in a particular case.

When a decision to administer both a corticosteroid and an antimicrobial is made, the administration of such drugs in combination has the advantage of greater patient compliance and convenience, with the added assurance that the appropriate dosage of both drugs is administered, plus assured compatibility of ingredients when both types of drugs are in the same formulation and, particularly, that the correct volume of drug is delivered and retained.

The relative potency of corticosteroids depends on the molecular structure, concentration and release from the vehicle.

INDICATIONS AND USAGE
For steroid-responsive inflammatory ocular conditions for which a corticosteroid is indicated and where bacterial infection or a risk of bacterial ocular infection exists.

Ocular steroids are indicated in inflammatory conditions of the palpebral and bulbar conjunctiva, cornea, and anterior segment of the globe where the inherent risk of steroid use in certain infective conjunctivitides is accepted to obtain a diminution in edema and inflammation. They are also indicated in chronic anterior uveitis and corneal injury from chemical, radiation or thermal burns; or penetration of foreign bodies.

The use of a combination drug with an anti-infective component is indicated where the risk of infection is high or where there is an expectation that potentially dangerous numbers of bacteria will be present in the eye.

The particular anti-infective drug in this product is active against the following common bacterial eye pathogens:
- Staphylococcus aureus,
- Escherichia coli,
- Neisseria species, and
- Pseudomonas aeruginosa.

This product does not provide adequate coverage against:
- Serratia marcescens
- Streptococcus pneumoniae.

CONTRAINDICATIONS
Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment is contraindicated in epithelial herpes simplex keratitis (dendritic keratitis), vaccinia, varicella, and many other viral diseases of the cornea and conjunctiva. Mycobacterial infection of the eye. Fungal diseases of ocular structures. Neomycin and Polymyxin B Sulfates and Dexamethasone Ophthalmic Ointment is also contraindicated in individuals with known or suspected hypersensitivity to a component of the medication. (Hypersensitivity to the antibiotic component occurs at a higher rate than for other components.)
WARNINGS

NOT FOR INJECTION. Use of ocular steroids may prolong the course and may exacerbate the severity of many viral infections of the eye and may mask symptoms of increase in intraocular pressure. Employment of steroid medication in the treatment of herpes simplex requires great caution; frequent slit lamp microscopy is recommended.

Prolonged use may result in glaucoma, with damage to the optic nerve, defects in visual acuity and fields of vision, and posterior subcapsular cataract formation. Use in patients with a history of allergy to any of the ingredients in the product, or the combination. Exact incidence figures are not available since no denominator of treated patients is available.

ADVERSE REACTIONS

ADVERSE REACTIONS

The use of steroids after cataract surgery may delay healing and increase the incidence of bleb formation.

Products containing neomycin sulfate may cause cutaneous sensitization. Sensitivity to topically administered aminoglycosides, such as neomycin, may occur in some patients. Severity of hypersensitivity reactions may vary from local effects to generalized reactions such as erythema, itching, urticaria, skin rash, anaphylaxis, anaphylactoid reactions, or bullous reactions. If hypersensitivitvity develops during use of this product, treatment should be discontinued. Cross-hypersensitivity to other aminoglycosides can occur, and the possibility that patients who become sensitized to topical neomycin may also be sensitive to other topical and/or systemic aminoglycoside should be considered.

PRECAUTIONS

General

The initial prescription and renewal of the medication order beyond 8 g of Neomycin and Polymyxin B Sulfaes and Dexamethasone Ophthalmic Ointment should be made by a physician after examination of the patient with the aid of magnification, such as a slit lamp biomicroscope and, where appropriate, fluorescein staining.

The possibility of persistent fungal infections of the cornea should be considered after prolonged steroid dosing. Fungal infection should be suspected in patients with persistent corneal ulceration.

Information for Patients

If inflammation or pain persists longer than 48 hours or becomes aggravated, the patient should be advised to discontinue use of the medication and consult a physician.

This product is sterile when packaged. To prevent contamination, care should be taken to avoid touching the tube tip to eyelids or to any other surface. Contact lenses should not be used in the eyes while the tube is in use. Keep tightly closed when not in use. Use within 1 year of opening.

Patients should be advised that their vision may be temporarily blurred following dosing with Neomycin and Polymyxin B Sulfaes and Dexamethasone Ophthalmic Ointment. Care should be exercised in operating machinery or driving a motor vehicle.

Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term studies in animals to evaluate carcinogenic or mutagenic potential have not been conducted with polymyxin B sulfate. Treatment of human lymphomas in vitro with neomycin increased the frequency of chromosomal aberrations at the highest concentration (80 μg/mL) tested. However, the effects of neomycin on carcinogenesis and mutagenesis in humans are unknown. Polymyxin B has been reported to impair the mobility of equine sperm, but its effects on male or female fertility are unknown.

Pregnancy

Dexamethasone has been shown to be teratogenic in mice and rabbits following topical ophthalmic application in multiples of the therapeutic dose. In the mouse, corticosteroids produce fetal resorptions and a specific abnormality, cleft palate. In the rabbit, corticosteroids have produced fetal resorptions and multiple abnormalities involving the head, ears, limbs, palate, etc.

There are no adequate or well-controlled studies in pregnant women. However, prolonged or repeated topical use during pregnancy has been associated with an increased risk of intra-uterine growth retardation. Neomycin, Polymyxin B Sulfaes and Dexamethasone Ophthalmic Ointment should be used during pregnancy only if the potential benefit to the mother justifies the potential risk to the fetus. Infants born of mothers who have received substantial doses of corticosteroids during pregnancy should be observed carefully for signs of hypoadrenalism.

Nursing Mothers

Systemically administered corticosteroids appear in human milk, could suppress growth, interfere with endogenous corticosteroid production, or cause other untoward effects. It is not known whether topical administration of corticosteroids could result in sufficient systemic absorption to affect milk and, where appropriate, fluorescein staining.

If inflammation or pain persists longer than 48 hours or becomes aggravated, the patient should be advised to discontinue use of the medication and consult a physician.

Additional adverse reactions identified from post market use include ulcerative keratitis, headache, and Stevens-Johnson syndrome.

ADVERSE REACTIONS

Adverse reactions have occurred with topical anti-infective combination drugs which can be attributed to the steroid component, the anti-infective component, or the combination. Exact incidence figures are not available since no denominator of treated patients is available.

Reactions occurring most often from the presence of the anti-infective ingredients are allergic sensitizations. The reactions due to the steroid component are: elevation of IOP with possible development of glaucoma, and infrequent optic nerve damage; posterior subcapsular cataract formation; and delayed wound healing.

Secondary Infection: The development of secondary infection has occurred after use of combinations containing steroids and antimicrobials. Fungal infections of the cornea are particularly prone to develop coincidentally with long-term applications of steroids. The possibility of fungal infection must be considered in any persistent corneal ulceration where steroid treatment has been employed. Keratitis, conjunctivitis, corneal ulcers, and conjunctival hyperemia have occasionally been reported following use of steroids. Secondary bacterial ocular infection following suppression of host responses occurs.

Additional adverse reactions identified from post marketing use include ulcerative keratitis, headache, and Stevens-Johnson syndrome.

To report SUSPECTED ADVERSE REACTIONS, contact Bausch + Lomb, a division of Valeant Pharmaceuticals North America LLC, at 1-800-321-4766 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

DOSEAGE AND ADMINISTRATION

Apply a small amount into the conjunctival sac(s) up to three or four times daily.

How to Apply Neomycin and Polymyxin B Sulfaes and Dexamethasone Ophthalmic Ointment: 1. Tilt your head back. 2. Place a finger on your cheek just under your eye and gently pull down until a “V” pocket is formed between your eyeball and your lower lid. 3. Place a small amount (about 1/2 inch) of Neomycin and Polymyxin B Sulfaes and Dexamethasone Ophthalmic Ointment in the “V” pocket. Do not let the tip of the tube touch your eye.

Not more than 8 g should be prescribed initially and the prescription should not be refilled without further evaluation as outlined in PRECAUTIONS above.

HOW SUPPLIED

Neomycin and Polymyxin B Sulfaes and Dexamethasone Ophthalmic Ointment is supplied as a STERILE ointment in a pre-printed aluminum tube with a natural HDPE cannula and a white HDPE cap.

KEEP OUT OF REACH OF CHILDREN.

FOR OPHTHALMIC USE ONLY
